Theme 6: Landed Cost | Project Proposal - English

1. Problem & Objective

Small U.S. importers need to know when changes in tariffs and freight costs make an alternative sourcing country financially attractive. Our approach: use real trade data to identify promising product categories first, then build a sourcing-switch decision tool.

2. Research Hypothesis & Analysis

Hypothesis: Categories with relatively small cross-country import cost gaps may have sourcing cost rankings that are more sensitive to tariff changes.

Data source	Role
USITC DataWeb	Customs value, import quantity, and international freight & insurance costs by HTS product and origin country
USITC HTS	Verify applicable tariff assumptions for the selected product and origin

Analysis: Screen 5-10 HTS product categories. Compute import unit values, freight & insurance per unit, and CIF per unit; compare cost gaps and alternative-country import shares. Apply verified tariff assumptions and select one category with a meaningful switching scenario.

3. Working Prototype

Inputs: Current and alternative origin; supplier unit quotes; freight per unit; tariff rates; order quantity (optional switching cost).
Outputs: Estimated landed cost comparison; break-even tariff threshold; potential savings; and a transparent Stay / Switch / Renegotiate indicator.

4. Build Plan - 3 to 4 Hours

Time	Deliverable
0-40 min	Retrieve and prepare a small trade-data sample
40-80 min	Cost-gap analysis and target category selection
80-110 min	Verify tariff assumptions and formulas
110-190 min	Build interactive threshold calculator
190-240 min	Test, write short document, and rehearse demo

5. Scope & Risks

Trade unit values are market averages, not supplier quotes. CIF includes international freight and insurance, so do not add those costs twice. Actual landed cost may include additional duties and fees. Switching also depends on capacity, quality, timing, and

one-time costs. Use historical data as a benchmark and editable user quotes for the decision model.

主題六：Landed Cost | Vibathon 專案提案－中文版

1. 問題與目標

美國中小型進口商面對關稅與運費變動時，往往難以判斷何時應考慮更換商品來源國。我們希望先利用眞實進口資料找出具有跨國成本競爭性的商品類別，再建立協助進口商決策的互動工具。

2. 研究假設與資料分析

研究假設：若同一類商品在不同來源國的平均進口成本差距較小，其成本排名可能更容易因關稅變動而翻轉。

資料來源	使用目的
USITC DataWeb	依 HTS 商品代碼及來源國，取得進口申報價值、進口數量、國際運費與保險成本
USITC HTS	確認所選商品與來源國適用的關稅假設

分析步驟：先選取 5—10 個 HTS 商品類別，計算各國平均進口單價、單位運費與保險費、單位 CIF 成本；比較跨國成本差距與替代來源國進口占比，再加入經確認的關稅假設，挑選一個適合展示轉換決策的商品類別。

3. 互動工具（MVP）

使用者輸入：現有及替代來源國、供應商單價、單位運費、關稅稅率、訂購數量（可選擇加入轉換成本）。
工具輸出：估計總進口成本比較、關稅損益兩平門檻、潛在節省金額，以及可解釋的 維持／轉換／重新議價（Stay / Switch / Renegotiate） 建議。

4. 開發時程－3 至 4 小時

時間	目標成果
0—40 分鐘	下載並整理小範圍進口資料
40—80 分鐘	成本差距分析、選定目標商品類別
80—110 分鐘	確認關稅假設及計算公式
110—190 分鐘	開發互動式轉換門檻計算器
190—240 分鐘	測試、撰寫簡短文件、演練 Demo

5. 限制與風險

進口平均單位價值是市場統計，不等於特定供應商報價。CIF 已包含國際運費與保險費，計算時不可重複加總；實際進口成本也可能包含其他稅費。供應商轉換仍須考慮產能、品質、交期及一次性成本。因此以歷史資料作爲市場參考，以使用者輸入的報價作爲實際決策模型依據。
